

# Day 21: Generics!

Welcome to Day 21! Check out [a video review of generics here](#), or just jump right into the problem.

Generic methods are a very efficient way to handle multiple datatypes using a single method.

**Note:** Fewer languages are enabled for this challenge because the concept of Generics is not common in many languages.

Let's say you have an integer array and a string array. You have to write a **single** method *printArray* that can print all the elements of both arrays. The method should be able to accept both integer arrays or string arrays.

You are given code in the editor. Complete the code so that it prints the following lines:

```
1
2
3
Hello
World
```

Do not use method overloading because your answer will not be accepted.

Good luck!
